

CALLINGAREAINFO™

Easily determine answers to key coverage questions

As the global leader in location intelligence in communications, MapInfo brings critical new data and capabilities to help carriers meet their customer needs more effectively and efficiently.

Summary

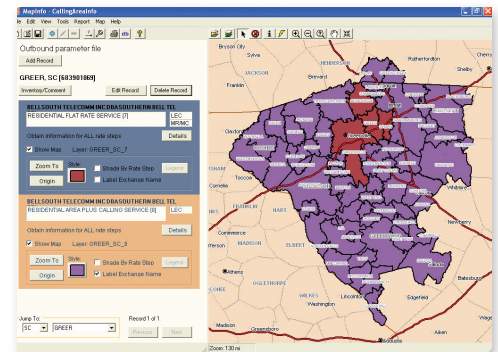

With competition and consolidation on the rise, providing your customers with the best local access possible is paramount. Utilizing local call plans allows companies to determine which phone numbers can locally call other numbers. Determining the coverage of your networks based upon this information provides your company with that next level of customer satisfaction—knowing you have them covered, the first time.

Overview

CallingAreaInfo eliminates the need to spend weeks poring over reams of cryptic tariff and regulatory data. What once took weeks can now be completed in minutes. Examine the local calling plan for calls which originate from a given location. The software produces a map of the calling region, a database of the area codes and exchanges covered by the plan, as well as respective rate information. Identify and map the exchanges which include a specific exchange in their calling plans. CallingAreaInfo can help optimize your network, if you provide access to customers and need to ensure local access to as many people as possible.

MapInfo broadens and speeds up your ability to make coverage decisions, with CallingAreaInfo. By assigning the correct local access number the first time, CallingAreaInfo can:

- Trim re-provisioning costs
- Reduce customer phone bill refunds
- Reduce equipment costs by efficiently covering markets

Compare call plans for selected regions, and (above) quickly see differences, and compare flat rate and multiple-step zones. (Left) See all call plans for an area, including most restrictive or most common.
